Continuation of 3. NOTE: Proposed claims 38 & 42 introduce new limitations ""wherein the casing unit is in the closed state, the first part of the container is inaccessible to the digit of the patient's hand. These limitations were not previously searched or examined and would require further consideration and/or search.

Continuation of 11. Regarding applicant's argument that Smith does not disclose a drug delivery device with a dispensing unit that is configured to be hand-operated both when fixedly secured to the casing unit and when the dispensing unit is independent from the casing unit has not been found convincing. The device of Smith has a switch 22 which may convert the inhaler between a breath-actuated mode and a press-and-breath mode. Thus, it is can be hand actuated. Furthermore, although the switch is converted into a breath actuated mode when the device is initially closed by flange 25 pushing on switch 22, it does not preclude one from opening the device (by moving the cover and attached flange 25 downward) and reactivating the press-and-breath mode, as the switch 22 allows it to be converted between a breath-actuated mode and a press-and-breathe mode. When the device of Smith is located in its protective housing it is configured to be hand actuated by engaging switch 22 and pressing downward (by hand) on the cover 38 to actuate the inhaler device. Regarding applicant's argument that Rand does not overcome the shortcomings of Smith, applicant is reminded that Rand was merely used to demonstrate the obviousness of the post and rack-and-pinion dose counter mechanism of claims 11-12 & 28-29.
